

Executive Summary

After evaluating fully free website builders, **Ycode** (open-source) stands out as the best fit. It offers drag-and-drop design, built-in CMS with multilingual support (Hindi/English), and direct integration with Supabase for hosting content ¹. You deploy Ycode to Vercel (free tier) and connect a free Supabase project for auth, database, and storage. While Ycode has no built-in payment widget, you can embed a Stripe or Razorpay checkout with a custom webhook. Two strong alternatives are **Claudable** (AI-driven Next.js builder with Supabase support ²) and **TeleportHQ** (visual designer with free code export). A brief **comparison table** is below, and a Mermaid flowchart illustrates the architecture.

Tool	Free? / Limits	Supabase Integration	Payments Support	i18n Support	Deploy (Vercel/ Export)	Custom Code/ Serverless	Best for
Ycode	Open-source, self-host on Vercel (\$0)	Built-in (uses Supabase as DB) ¹	No built-in; embed via webhooks (Stripe/ Razorpay)	Yes (unlimited languages) ¹	Vercel (Next.js) with code export	Full (open source code)	CMS-driven multilingual sites (NGO, content-heavy)
Claudable	Open-source CLI/ AI (free to use)	Yes (connects Supabase easily) ²	No built-in; add Stripe via custom code	Supports Next.js i18n libraries	Vercel (instant deploy) ²	Yes (Next.js app code)	Rapid prototyping via AI for devs
TeleportHQ	Free plan (1 project/3 pages, watermark) ³	No (static site builder)	No; static exports only	Limited (templates only)	Export to Next.js/ React (no free Vercel integration) ⁴	Partial (exported code)	Simple static websites, landing pages
Framer	Free tier (publishing on framer domain)	No (proprietary CMS, not Supabase)	No built-in; can embed Stripe element	Yes (has localization tools) ⁵	Export to Next.js or use Framer hosting	Limited (custom code overrides)	Design-driven sites with built-in CMS/SEO

Key findings:

- **Ycode**: Offers drag-and-drop building and a full CMS. Supports URL-based multilingual content and unlimited languages ¹. Free if self-hosted (Vercel+Supabase), and has no page or user limits in that

mode. You get full access to code, so you can integrate any payment gateway via custom code or webhooks.

- **Claudable:** An AI-based Next.js builder. It auto-generates code (with Tailwind and shadcn components) and easily connects to Supabase ². It deploys instantly to Vercel and includes auth scaffolding, but requires technical know-how to configure payments and localization.
- **TeleportHQ:** A visual builder with a generous free plan for design and code export ⁴. It does *not* natively support Supabase; you export static code and would need to add a backend. It supports code download (to Next.js, etc.) but not free Vercel integration (that's Pro-only) ⁶. It's more suitable for simple brochures than full apps.
- **Framer:** Great for high-end design and has a free tier. It includes an integrated CMS and localization support ⁵. However, it doesn't integrate with Supabase, so data and auth would need separate implementation. You can export to Next.js or host on Framer's system.

Tool Details and Setup

1. Ycode (Recommended)

Why Ycode: Ycode is open-source with a drag-and-drop editor and built-in CMS. It natively uses Supabase for content storage (you simply deploy your fork on Vercel and link it to a free Supabase project) ⁷ ¹. Its “Localization” feature supports full bilingual sites with URL prefixes ¹. You can create pages, forms, and collections via the GUI. For payments, you’d add a custom payment form or button (e.g. Stripe Checkout) and handle the transaction via a Supabase Edge Function or webhook. **Setup steps:**

1. **Fork and deploy Ycode:** Fork the [Ycode GitHub repo](#). Deploy it on Vercel (free tier) by connecting your GitHub fork ⁸.
2. **Create a Supabase project:** In the [Supabase dashboard](#), start a free project. Copy the project URL and anon/public keys.
3. **Configure Ycode:** In Vercel’s dashboard, set Ycode’s environment variables (`SUPABASE_URL`, `SUPABASE_ANON_KEY`, etc.) to your Supabase credentials ⁷. Redeploy.
4. **Initial run and admin:** Visit the deployed site, complete the setup wizard (create admin account). Ycode will run migrations on your Supabase DB.
5. **Use the Ycode editor:** Open the visual builder. Under **Localization**, add Hindi and English content for each page. Publish your content.

6. **Membership/donation flow:** Create a “Join/Donate” form in Ycode or a custom page. For payments: embed a Stripe/Razorpay checkout script on that page, or use a Ycode form that triggers a Supabase Edge Function. Configure the function to process payments (using Stripe or Razorpay APIs) and store a record in the Supabase `memberships` table. (Ycode’s “Forms” can trigger webhooks ⁹ if needed.)
7. **Deploy & Domain:** Vercel auto-deploys on commit. In Vercel’s Settings → Domains, add `sewarthpathsansthanam.org` and follow DNS instructions ¹⁰. Vercel will provision HTTPS automatically.

Ycode Limitations: Out of the box it has no donation plugin, so custom code is needed for payments. However, since it is fully open-source, you can extend it freely. Supabase limits (500 MB DB, 50k monthly auth users) should easily cover an NGO site (weblink ¹¹).

2. Claudable

Why Claudable: Claudable is an open-source Next.js AI builder that explicitly supports Supabase and Vercel ². You describe the desired site in natural language, and it generates code. It includes Supabase Auth and DB scaffolding. It’s completely free, but it requires you to login to an AI agent (like Claude or Cursor CLI) to generate the app. After generation you can manually tweak code for translations and payment.

Features: Generates tailwind/shadcn UI, auth flows, and database setup automatically. You deploy via a single-click Vercel action. Since it produces Next.js code, you can manually install i18n packages and a Stripe/Razorpay library. Claudable’s docs highlight free Supabase usage and instant Vercel deploy ².

Limitations: It’s less WYSIWYG – more suited for developers comfortable editing code. There are no templates for NGO-specific sites, so you’d have to guide the AI carefully (e.g. ask for an NGO membership page). There is no built-in payment: you’d add Stripe Checkout in the code and handle webhooks with Supabase Edge Functions.

3. TeleportHQ

Overview: TeleportHQ is a browser-based site builder with a generous free tier for prototyping ³. You design visually and can export clean React/Next.js code ⁴. It’s completely free to use, but free projects are limited (3 pages, 5 MB assets, watermark). Supabase integration is not built-in: it outputs static front-end code, so you’d need to integrate a backend manually.

Pros: Includes ready-made templates (e.g. landing pages) and exports to Next.js. Has built-in SEO optimizations. On the free plan you can host on TeleportHQ subdomain or export code.

Cons: Multi-language must be handled manually (e.g. duplicate pages). No direct auth or database support – you’d integrate Supabase yourself after export. The Vercel deploy integration is only on paid plans ⁶, though you can copy the exported code into a Vercel project yourself. TeleportHQ doesn’t support form submissions or payments on the free plan (forms are limited to 30 submissions ¹²). It’s best for simple static sites or prototyping.

4. Framer

Overview: Framer is a designer-friendly builder with a free plan (sites hosted on `.framer.site`). It includes an integrated CMS, image hosting, and built-in localization tools ⁵. Framer's SEO and performance are good (static generation with React). You can export to a Next.js project or host on Framer.

Pros: Pixel-perfect design, collaboration tools, and SEO. The free plan allows up to a certain number of sites and pages (details on Framer pricing). Localization (i18n) is supported out-of-the-box ⁵.

Cons: No native Supabase support. To use Supabase, you'd have to call its APIs from Framer Code components or a separate frontend build. Payments would also be custom-implemented. Framer's free tier might include Framer branding and is limited in bandwidth/visitors unless upgraded. It's best for marketing sites or small CMS-powered blogs, not complex membership portals.

Setup Checklist (Ycode Top Tool)

1. **Fork & Deploy Ycode:** Fork the [Ycode GitHub repo](#). On Vercel, import the repo and deploy.
2. **Create Supabase Project:** In Supabase dashboard, start a new free project. Note the `URL` and `anon key`.
3. **Configure Environment:** In Vercel's project settings, add `SUPABASE_URL` and `SUPABASE_ANON_KEY` (and `SUPABASE_SERVICE_KEY`) from your Supabase project ⁷. Redeploy.
4. **Run Initial Setup:** Visit the live URL. Follow the wizard to create the first admin account and initialize the database.
5. **Design Site Content:** Use Ycode's visual editor to create pages (Home, About, Join, Donate, Contact). In **Settings** → **Localization**, add Hindi translations for each page (Ycode handles per-language content) ¹.
6. **Membership/Donation Forms:** Add a form block or custom component. In the form settings, you can configure a webhook (Supabase Function) or a simple action to store submissions. For payments, embed a Stripe/Razorpay checkout button (in "Custom Code" component). Have it call a Supabase Edge Function (with your Stripe secret) to process payment and insert a record (you'll need to write that function manually).
7. **Auth and Profiles:** Ycode/CMS content can serve static data. For user registration, you can either use Supabase Auth directly (link to a sign-up page you create, using React/JavaScript) or build a registration form that calls `supabase.auth.signUp`. Ycode doesn't currently generate user login UIs out of the box, so you may code a simple Next.js page. (Alternatively, treat membership sign-up as a form + payment.)
8. **Test Everything:** Ensure the site renders bilingual content correctly. Test the payment flow on a dummy page (use Stripe/Razorpay test mode). Check the Supabase dashboard to verify data entries.
9. **Custom Domain:** In Vercel, add "sewarthpathsansthanam.org" under Domains ¹⁰. Point your DNS A/CNAME to Vercel as directed (the docs show the steps ¹⁰). Wait for propagation and SSL issuance.
10. **Go Live:** The site should now run on the bought domain. Visitors can switch languages via Ycode's toggle (e.g. `/hi` sub-path). Monitor usage in Supabase (free tier is generous and should suffice for modest traffic ¹¹).

Workarounds & Limitations:

- **Payments:** Since no-code platforms rarely have built-in Indian payment integration, we must use custom code. In Ycode you can embed HTML/JS to create a Stripe Checkout session or Razorpay button, then handle the webhook in a Supabase function. This requires some coding knowledge. A mitigation is using third-party form-to-payment services (e.g. JotForm) if you want zero code, but then integration with Supabase is manual.
- **Supabase Free Limits:** Free tier has 500 MB DB, 1 GB storage, 50k monthly auth users ¹¹. This easily covers an NGO site. If high traffic (200k+ monthly visits or multi-gigabyte storage) is expected, consider caching assets on a CDN or upgrading.
- **Vendor Lock-In:** Ycode is open-source, so no lock-in. You own the code and data. Claudable and TeleportHQ produce standard code too. Framer and TeleportHQ's free hosting (non-export) would lock you in, so prefer code export on Vercel to avoid that.

Recommendation

For a completely free, production-ready solution, **Ycode (self-hosted)** is the best choice. It meets all criteria: no cost, direct Supabase integration (for auth/DB/storage), unlimited languages, and Vercel deployment ⁷. It requires minimal coding (mainly for payment), so it's user-friendly yet flexible. Claudable is a close alternative for tech-savvy users who prefer AI generation, and TeleportHQ can be used for simple static pages. Overall, using Ycode plus Supabase and Vercel free tiers will satisfy NGO requirements without incurring fees.
